To start with, I want to save them to disk, to be able to further process them for behavior testing using OpenCV. Here is a screenshot of the data, also showing that I want to save it to disk: I've tried saving it in a.png but it's not recognizing it as a valid image. A: 1. Using scikit-image You can load them using image, _ = scipy.io.loadmat('C:\path\to\your\file.mat') After that, you can just save them: image.tofile('C:\path\to\ew\file.png') 2. Using imagemagick Let's assume that your images are stored in a folder on your file system, the full path of which is C:\path\to\your\file\folder. The following command simply will save each of your image files as a JPEG file: for img in glob.glob('C:\path\to\your\file\folder*.png'); do echo "Saving \$img" convert "\$img" -quality 100 -normalize "\$img".jpg done If you wanted to save each image in a separate folder, you can do something like: for dir in C:\path\to\your\file\folder\foo\bar; do convert "\$dir\your-image-folder-path-here/*.png" -quality 100 -normalize "\$dir\your-image-folder-path-here/*.png".jpg done Read more about converting files with imagemagick here. 3. Using PyImageMagic At first you have to install PyImageMagic in a Python script on your machine, with the following commands: pip install pyimage Then, you can convert a batch of pngs: pyimage.convert(dir='C:\path\to\your\file\folder/', image_types='PNG') 1cd36666d

A developer plugin allows you to operate the Sonos hardware using a simple set of commands. When you develop an app, you create and publish it as a Sonos plugin, which is basically a server application program. Once the server is set up, it communicates with the Sonos controllers. Here is a quick walkthrough of the set up process. The Benefits The principle benefit of using developer plugins is that you don't have to acquire the Sonos hardware and set up your own network. The network setup process can become time-consuming. You can create your own application that requires the minimum set of skills. You can also test the app using a development network with a small set of Sonos players. Code Execution Using the Sonos Developer Plugin API, you can control the Sonos hardware and communicate with the devices via Web Services. There are two types of control: Remote control and hands-free control. Remote Control Remote control, also known as remote control as a service (RCaaS), allows you to use the Sonos controller to control a physical Sonos player. For example, you could remotely control a Sonos Play:1 player from your development workstation through the API. The developer plugin API is a wrapper for the Sonos Controller API. It lets you control the devices through Sonos Controller API. The controller API is a REST-based API that is designed to be used from a web browser or using a JavaScript-enabled application. Hands-free control Hands-free control allows you to use the controller on your smartphone or tablet to control the Sonos player. This is a much faster way to control the player. To start hands-free control, you will need to setup the controller on your device. To setup hands-free control, just follow the instructions from the Sonos documentation. To start hands-free control, configure the Sonos Controller API with your device. Note
